

Zhen CRM Installation

Requirements

- HTTP server example Apache
- PHP 5.2.8 or greater
- MYSQL 4 or greater

Installation

1. Extract and copy Zhen-CRM in webroot of your server.
2. Open **database.php** form **\app\Config** directory. If there is no **database.php** file then rename **database.php.default** to **database.php**

```
54 * For MySQL to connect via socket specify the `unix_socket` parameter instead of `host`
55 */
56 class DATABASE_CONFIG {
57
58     public $default = array(
59         'datasource' => 'Database/Mysql',
60         'persistent' => false,
61         'host' => 'localhost',
62         'login' => 'user',
63         'password' => 'default',
64         'database' => 'zhen',
65         'prefix' => '',
66         //'encoding' => 'utf8',
67     );
68
69     public $test = array(
70         'datasource' => 'Database/Mysql',
71         'persistent' => false,
72         'host' => 'localhost',
73         'login' => 'user',
74         'password' => 'password',
75         'database' => 'test_database_name',
76         'prefix' => '',
77         //'encoding' => 'utf8',
78     );
79 }
```

3. Find code similar to above screenshot and provide MySql database name, Hostname, Username and Password then save the file. Prefix is optional you can use it if you share database with other application.
4. Run sql script **crm.sql** from **\app\teleirim\sql** directory. This will create all necessary table structure for running CRM application.
5. Now you are done. You can login with default administrator, username: **admin** and password: **admin@123**

6. Optionally you can insert sample data by running **crm_sample.sql**
